

A Catalog of the Type Specimens of Fishes Formerly in the  
Collections of the Department of Tropical Research,  
New York Zoological Society<sup>1</sup>

GILES W. MEAD<sup>2</sup>

**D**URING the past thirty-five years the Department of Tropical Research of the New York Zoological Society, under the direction of Dr. William Beebe, has contributed much to the study of fishes. The active field program resulted in large collections which were maintained and studied in the Department's laboratory in the Zoological Park and in a long series of technical publications. In recent years, Dr. Beebe has donated parts of this collection to several institutions, where they continue to contribute to ichthyological research. The distribution of the Department's collection of fishes was completed in 1957 with the transfer of the remaining specimens to the U. S. National Museum and the Natural History Museum, Stanford University. The type material resulting from the Department's work is now in the collections of these two institutions and four others to which specimens were given prior to 1957.

The list which follows has been prepared, at Dr. Beebe's request, primarily to make known the present location of this type material. Its compilation was simplified by the catalogs and indices maintained by Dr. Beebe and through the cooperation of the curators of the several museums that now contain collections assembled by the Department of Tropical Research.

The list is alphabetical, and all species are listed under the genus in which they were first described, regardless of subsequent transfer. Four species of deep-sea fishes were described by Dr. Beebe from sight observations from the bathysphere. These four, *Bathysphaera intacta* (Beebe, 1932, Bull. New York Zool. Soc., 35

(5): 175), *Bathycerantias trilychnus*, *Bathyembryx istiophasma* and *Bathysidus pentagrammus* (Beebe, 1934, *ibid.*, 37 (6): 190-192), have been omitted.

The following abbreviations have been used:
